One workflow across models and subscriptions

AI model routing

How do you build and review with different AI models
without moving the work between apps?

One possible solution: use a model proxy server

Usage follows the subscription login or API key on the selected route.

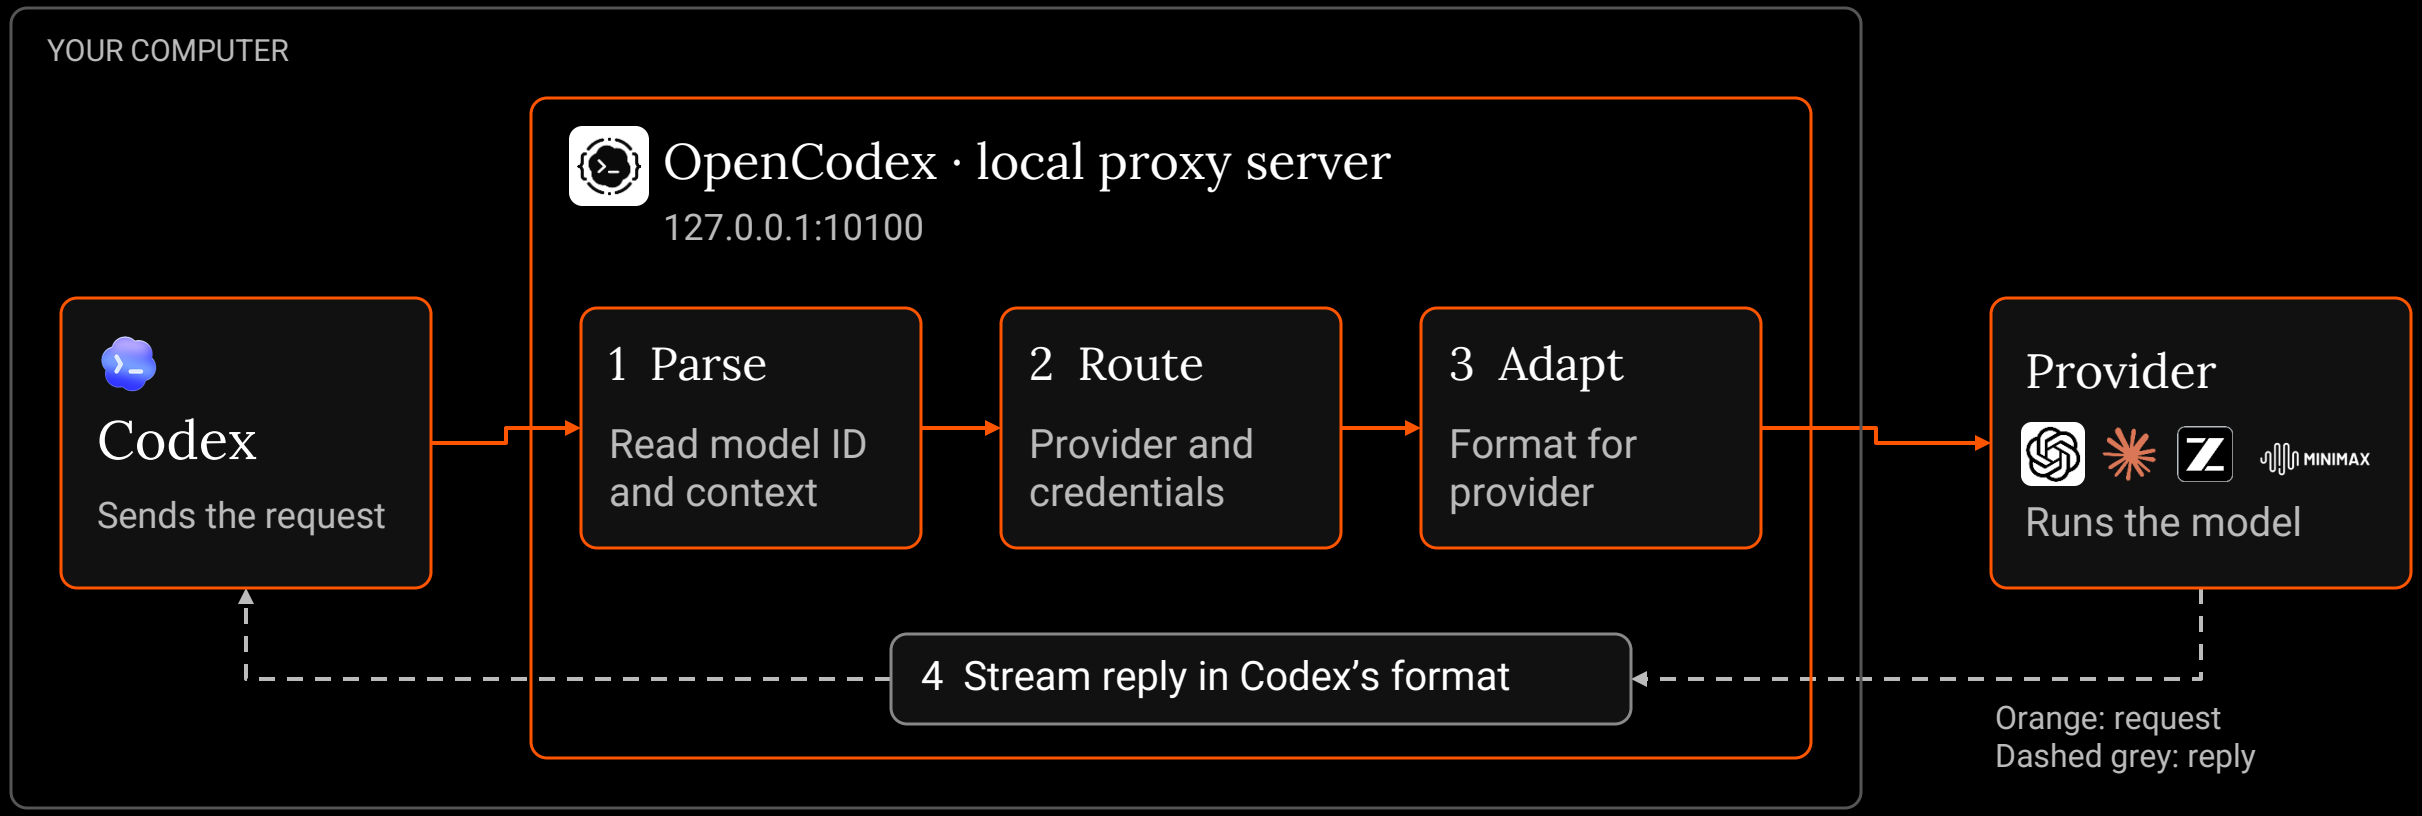

I use OpenCodex, which routes provider models into Codex through a local proxy.

Keeps the entire workflow within Codex.

How the proxy routes a request

Example: a request to a model hosted by another provider

Codex coordinates the work and runs local tools; the proxy routes each request.

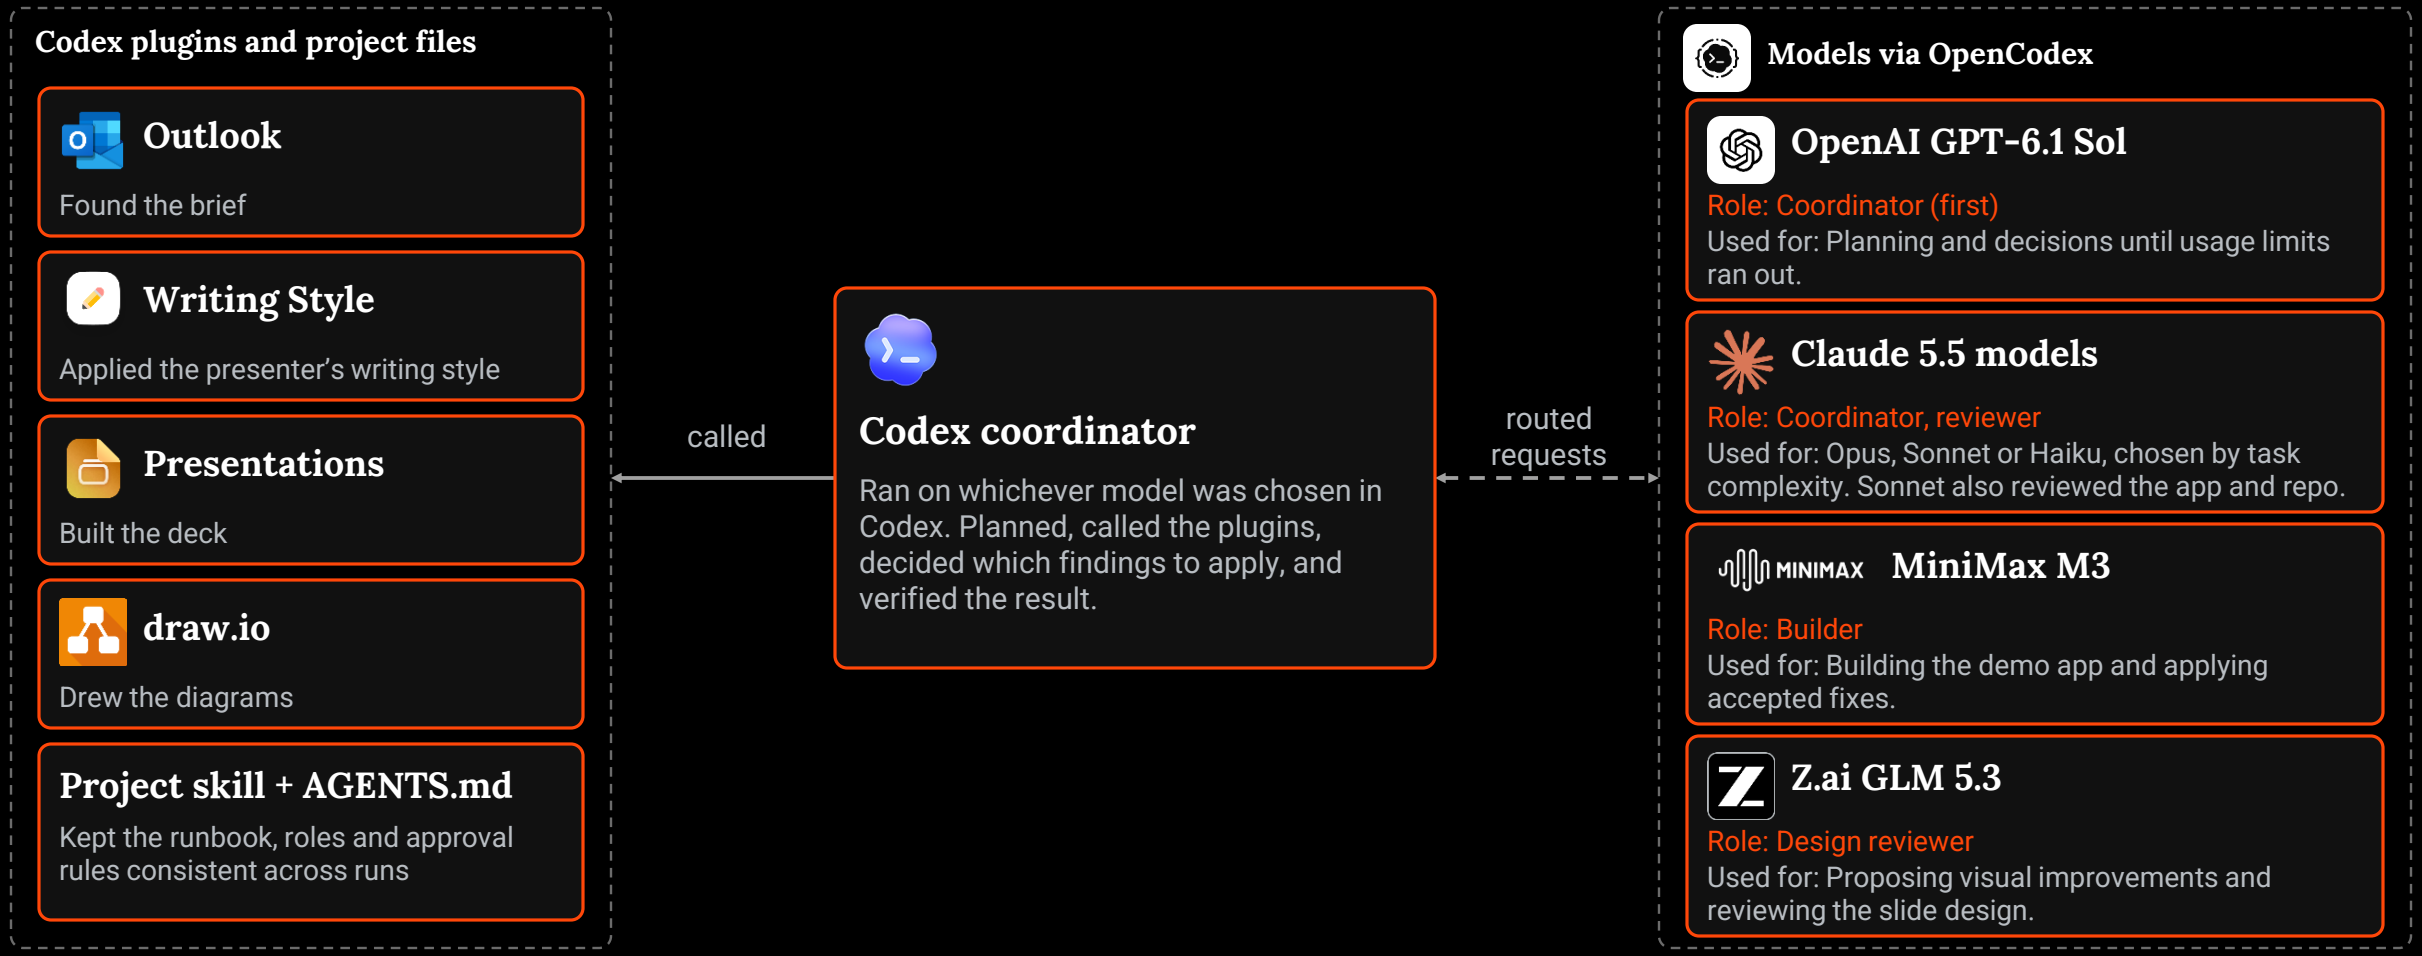

A worker request takes the same path, with its own brief and context.

Switch models mid-chat, delegate jobs to subagents using a different model.

Demo: one build, two reviews

How this lesson was produced

The coordinator's model changed without changing the workflow.

Many models, one workflow

Problem statement

How do you build and review with different models without moving the work between apps?

One possible solution

Use a local model proxy server (e.g. OpenCodex), send each job to the right model, and let the coordinator decide which fixes to apply.

Any Questions?
